The National Center for Education Statistics (NCES) is the primary federal entity for collecting, analyzing, and reporting data related to education in the United States and other nations. It fulfills a congressional mandate to collect, collate, analyze, and report full and complete statistics on the condition of education in the United States; conduct and publish reports and specialized analyses of the meaning and significance of such statistics; assist state and local education agencies in improving their statistical systems; and review and report on education activities in foreign countries.

NCES activities are designed to address high-priority education data needs; provide consistent, reliable, complete, and accurate indicators of education status and trends; and report timely, useful, and high-quality data to the U.S. Department of Education, the Congress, the states, other education policymakers, practitioners, data users, and the general public. Unless specifically noted, all information contained herein is in the public domain.

We strive to make our products available in a variety of formats and in language that is appropriate to a variety of audiences. You, as our customer, are the best judge of our success in communicating information effectively. If you have any comments or suggestions about this or any other NCES product or report, we would like to hear from you. Please direct your comments to

Summary

Introduction

Dropping out of high school is related to a number of negative outcomes. For example, the median income of high school dropouts age 18 and over was $12,184 in 2003 (U.S. Census Bureau 2005a). By comparison, the median income of those age 18 and over who completed their education with a high school credential (including a General Educational Development certificate, or GED) was $20,431. Dropouts are also less likely to be in the labor force than those with a high school credential or higher, and are more likely to be unemployed if they are in the labor force (U.S. Department of Labor 2005). In terms of health, dropouts over the age of 24 tend to report being in worse health than adults who are not dropouts, regardless of income (U.S. Department of Education 2004). Dropouts also make up disproportionately higher percentages of the nation's prison and death row inmates.[1]

This report builds upon a series of National Center for Education Statistics (NCES) reports on high school dropout and completion rates that began in 1988. It presents estimates of most rates in 2004, provides data about trends[2] in dropout and completion rates over the last three decades (1972–2004), and examines the characteristics of high school dropouts and high school completers in 2004. Four rates are presented to provide a broad picture of high school dropouts and completers in the United States, with each contributing unique information: the event dropout rate, the status dropout rate, the status completion rate, and the averaged freshman graduation rate.

- The **event dropout rate** estimates the percentage of both private and public high school students who left high school between the beginning of one school year and the beginning of the next without earning a high school diploma or its equivalent (e.g., a GED). It can be used to track annual changes in the experiences of students in the U.S. school system.

- The **status dropout rate** reports the percentage of individuals in a given age range who are not in school and have not earned a high school diploma or equivalency credential, irrespective of when they dropped out. The rate focuses on an overall age group as

---

[1] Estimates indicate that approximately 30 percent of federal inmates, 40 percent of state prison inmates, and 50 percent of persons on death row are high school dropouts (U.S. Department of Justice 2000, 2002).

[2] Trend analyses have shown a pattern of decline in event dropout rates prior to 1990, and no consistent upwards or downwards trend since then. As a result, in this report, overall trends from 1972 to 2004 are reported, as well as separate trends from 1972 to 1990 and 1990 to 2004, to increase the understanding of patterns over time in these rates.

opposed to individuals in the U.S. school system, so it can be used to study general population issues.

- The **status completion rate** indicates the percentage of individuals in a given age range who are not in high school and who have earned a high school diploma or equivalency credential, irrespective of when the credential was earned. The rate focuses on an overall age group as opposed to individuals in the U.S. school system, so it can be used to study general population issues.[3]

- The **averaged freshman graduation rate** estimates the proportion of public high school freshmen who graduate with a regular diploma 4 years after starting 9th grade. The rate focuses on public high school students as opposed to all high school students or the general population and is designed to provide an estimate of on-time graduation from high school. Thus, it provides a measure of the extent to which public high schools are graduating students within the expected period of 4 years.

Data presented in this report are drawn from the annual October Current Population Surveys (CPS), the annual Common Core of Data (CCD) collections, and the annual GED Testing Service (GEDTS) statistical reports.[4] Data in the CPS files are collected through household interviews and are representative of the civilian, noninstitutionalized population in the United States. The CCD data are collected from state education agencies about all public schools and school systems in the United States, and contain administrative record data that are representative of all public school students in this country. The GEDTS data are also built from administrative record data kept by the testing service, and contain information about all GED test takers (data presented in this report are only for test takers in the 50 states and the District of Columbia).

As with all data collections, those used in this report are useful for calculating some estimates but are poorly suited for calculating other types of estimates. For example, CPS data are well suited for studying the civilian, noninstitutionalized population in the United States, but do not provide information about military personnel or individuals residing in group quarters such as prison inmates. Data from CCD are appropriate for studying public school students in a given year, but do not provide information on private school students. GEDTS data are helpful for identifying the number of people who take and pass the GED examination in a given year, but do not contain information about schools that GED test takers attended before taking the GED test. In addition, none of the datasets track individual students over time, limiting their usefulness for studying processes and precise timelines associated with graduating or dropping out.

---

[3] This rate is referred to as the "Current Population Survey High School Completion Indicator" in an NCES technical report (Seastrom et al. 2006a).

[4] Appendix A of this report contains information about these three data collections and describes in detail how the rates reported here were computed.

All changes or differences noted in this report are statistically significant at the *p* < .05 level. When significance tests fail to meet the *p* < .05 criterion and the comparison is of substantive interest, terminology such as "no measurable difference was found" is used in this report. This does not necessarily mean that there is no actual difference between the compared estimates. With a larger sample, the difference may or may not have tested significant at the *p* < .05 level.

In addition to the tables included in this report, a set of supplemental tables is available at http://nces.ed.gov/pubsearch/pubsinfo.asp?pubid=2007024. Those tables present information about status dropout rates for students who have been retained in school, students with disabilities, and Hispanic immigrants, including information on English proficiency and prior enrollment in U.S. schools.

Selected Findings

National Event Dropout Rates

The event dropout rate presented here estimates the percentage of both private and public high school students who left high school between the beginning of one school year and the beginning of the next without earning a high school diploma or its equivalent such as a General Educational Development (GED) certificate. Specifically, the rate describes the percentage of youth ages 15 through 24 in the United States who dropped out of grades 10–12 from either public or private schools in the 12 months between one October and the next (e.g., October 2003 to October 2004). The measure provides information about the rate at which U.S. high school students are leaving school without a successful outcome. As such, it can be used to study student experiences in the U.S. secondary school system in a given year. It is not well suited for studying how many people in the country lack a high school credential irrespective of whether they attended U.S. high schools, nor does it provide a picture of the dropout problem more generally because it only measures how many students dropped out in a single year. Data from the Current Population Survey (CPS) are used to calculate national event dropout rates.

- **National event dropout rates:** About 5 out of every 100 students enrolled in high school in October 2003 left school before October 2004 without completing a high school program (table 1). Since 1972, event dropout rates have trended downward, from 6.1 percent in 1972 to 4.7 percent in 2004 (figure 1 and table 2). This decline occurred primarily from 1972 through 1990. Despite year-to-year fluctuations, there has been no overall pattern of increase or decrease in event dropout rates since 1990.

- **Event dropout rates by sex:** There was no measurable difference in the 2004 event dropout rates for males and females, a pattern generally found over the last three

decades (tables 1 and 3). Exceptions to this pattern occurred in 4 years—1974, 1976, 1978, and 2000—when males were more likely than females to drop out.

- **Event dropout rates by race/ethnicity:**[5] Among the four largest racial/ethnic groups shown in table 1, Hispanic students were the most likely to drop out in 2004 (8.9 percent), followed by Black students (5.7 percent), White students (3.7 percent), and Asian/Pacific Islander students (1.2 percent).[6] The rate for students who indicated more than one race (4.9 percent) was not measurably different from the rates for the other racial/ethnic groups.[7]

- **Event dropout rates by family income:** In 2004, the event rate for students living in low-income families was approximately four times greater than the rate of their peers from high-income families (10.4 percent compared with 2.5 percent) (table 1).[8]

  A decline in event dropout rates for students from low-, middle-, and high-income families occurred from the mid-1970s to 1990 (figure 1 and table 4). Since 1990, event dropout rates have fluctuated between 3.6 and 5.7 percent for middle-income students and between 1.0 and 2.7 percent for high-income students, without a consistent upward or downward trend for either group (table 4). However, for low-income students, event dropout rates increased from 9.5 percent in 1990 to 13.3 percent in 1995 and then declined to 10.4 percent in 2004.

- **Event dropout rates by age:** Students who pursue a high school education past the typical high school age are at higher risk than others of becoming an event dropout (table 1). The 2004 event dropout rates for students in the typical age range for fall high school enrollment (ages 15 through 17) were lower than those for older students (ages 19 through 24). Specifically, 4.0 percent of 15- to 16-year-olds and 3.1 percent of 17-year-olds dropped out in the 1-year reference period, compared with 7.6 percent of 19-year-olds and 28.2 percent of 20- through 24-year-olds.[9]

---

[5] Beginning in 2003, CPS respondents were able to indicate more than one race. Only 2 percent of 15- through 24-year-olds who were enrolled in high school in 2003 (the base population for the 2004 event dropout rate) reported more than one race (table 1). The tables reporting data for 2004 include five racial/ethnic categories: White, non-Hispanic; Black, non-Hispanic; Asian/Pacific Islander, non-Hispanic; Hispanic; and more than one race. The first three categories consist of individuals who identified as only one race, and who did not identify as Hispanic. A fourth category consists of Hispanics of all races and racial combinations. The "more than one race" category consists of non-Hispanics who identified as being multiracial. Due to small sample sizes, American Indians/Alaska Natives who reported only one race are included in the total but are not shown separately. The CPS tables with data from 1972 to 2004 have two race classification schemes. For the 2003 and 2004 data, the race categories follow the definitions described above for 2004. Prior to 2003, respondents could indicate only one race. The four racial/ethnic categories reported in this publication for 2002 and earlier data are White, non-Hispanic; Black, non-Hispanic; Hispanic (any race); and Asian/Pacific Islander, non-Hispanic. American Indians/Alaska Natives are included in the totals but are not shown separately. For ease of reading, the shorter terms White, Black, and Asian/Pacific Islander are used.

[6] The differences between each of these groups were statistically significant.

[7] Due to a small sample size, the standard error for students who identify with more than one race is relatively large, which makes the detection of statistically significant differences difficult.

[8] "Low-income" is defined here as the lowest 20 percent of all family incomes, while "high-income" refers to the top 20 percent of all family incomes. In 2004, low-income families included those with $16,333 or less in family income, while high-income families included those with $77,235 or more in family income.

[9] Eighteen-year-olds represent a transitional population in terms of high school education. Many are still in high school, while a large proportion has entered postsecondary education or the labor market (U.S. Census Bureau 2005b). As such, they are not included with those who are age 17 and under, or age 19 and over, in this analysis.

- **Event dropout rates by region:** In 2004, the West and the South registered a higher event dropout rate than the Northeast and the Midwest (6.1 percent, 5.4 percent, 3.8 percent, and 3.1 percent, respectively) (table 1). It is not appropriate to consider these rates as reflecting the performance of schools in each of the regions. There are a number of reasons the rates cannot be used to directly evaluate school system performance including lack of controls for migration and immigration.

State Event Dropout Rates for Public High School Students

State-level event dropout rates for public high school students are calculated using data from 1993 through 2002 from the Common Core of Data (CCD). The rates reported in this publication reflect the percentage of public school students who were enrolled in grades 9–12 at some point during the 2001–02 school year, were not enrolled in school in October of 2002, and had not earned a high school diploma or completed a state- or district-approved education program.[10, 11] State or district education programs may include special education programs and district- or state-sponsored GED programs. State event dropout rates shown here indicate the rate at which students are dropping out of public secondary systems in a given year. They do not include information about individuals outside of the public school system nor about individuals who may have dropped out during a preceding school year. Rates are presented for the 45 states and the District of Columbia that used this common definition of what constitutes a dropout (table 5). (See the Technical Notes in appendix A for the dropout definition.) Because some states do not follow the NCES reporting rules, the CCD data cannot be used to calculate national-level event dropout rates from public schools.[12]

- **State event dropout rates for 9th- through 12th-grade public high school students:** The 2001–02 CCD event dropout rates ranged from 1.9 percent in Wisconsin to 10.5 percent in Arizona (table 5).

  In all, event dropout rates for public school students in grades 9–12 were lower than 3 percent in nine states: Wisconsin, 1.9 percent; North Dakota, 2.0 percent; Indiana, 2.3 percent; Iowa, 2.4 percent; New Jersey, 2.5 percent; Connecticut, 2.6 percent; Maine and South Dakota, 2.8 percent; and Virginia, 2.9 percent (table 5). Nine states had event dropout rates of 6 percent or more: Delaware, 6.2 percent; Illinois and Nevada, 6.4 percent; Georgia, 6.5 percent; Louisiana, 7.0 percent; Washington and New York, 7.1 percent; Alaska, 8.1 percent; and Arizona, 10.5 percent.

---

[10] Some states report using an alternative 1-year period from one July to the next. Rates for those states are presented because event dropout rates based on the July-to-July calendar are comparable to those calculated using an October-to-October calendar (Winglee et al. 2000).

[11] At the time of publication, the 2001–02 CCD state dropout rates were the most current available. These state rates were reported in a previous NCES *Dropout Rates* report (Laird et al. 2006). They are included here in order to present a number of different dropout indicators together in one report.

[12] NCES is studying imputation strategies for missing dropout data.

National Status Dropout Rates

The status dropout rate measures the percentage of individuals who are not enrolled in high school and who do not have a high school credential, irrespective of when they dropped out. The status dropout rate is higher than the event rate in a given year because the status dropout rate includes all dropouts in a particular age range, regardless of when or where they last attended school, including individuals who did not attend school in the United States. The measure provides an indicator of the proportion of young people who lack a basic high school education. While useful for measuring overall educational attainment among young adults in the United States, the status dropout rate is not useful as an indicator of the performance of schools because the rate includes those who never attended school in the United States. Using data from the CPS, the status dropout rate in this report shows the percentage of young people ages 16 through 24 who are out of school and who have not earned a high school diploma or equivalent credential (e.g., a GED).

- **National status dropout rates:** In October 2004, approximately 3.8 million 16-through 24-year-olds were not enrolled in high school and had not earned a high school diploma or alternative credential such as a GED (table 6). These status dropouts accounted for 10.3 percent of the 36.5 million 16- through 24-year-olds in the United States in 2004.

   Among all individuals in this age group, status dropout rates declined between 1972 and 2004, from 14.6 percent to 10.3 percent (figure 2 and table 7). Unlike event dropout rates, which have no general patterns between 1990 and 2004, status rates declined over this period.

- **Status dropout rates by sex:** Males ages 16–24 were more likely than females to be high school status dropouts in 2004 (11.6 percent compared with 9.0 percent) (table 6).

- **Status dropout rates by race/ethnicity:** The status dropout rate of Whites remained lower than that of Blacks in 2004, but over the past three decades the difference between Whites and Blacks has narrowed (figure 2 and table 8). The narrowing of the Black-White gap occurred during the 1980s, with no measurable change during the 1970s or between 1990 and 2004.

   In 2004, Asian/Pacific Islanders ages 16–24 were less likely to be status dropouts than Whites, Blacks, and Hispanics in this age group.[13] The percentage of Hispanics ages 16–24 who were dropouts was consistently higher than that of Blacks and Whites throughout this 32-year period (1972–2004; figure 2 and table 8). White and Black status dropout rates have fallen by about half since 1972; the rates for Whites fell from 12.3 to 6.8 percent and the rates for Blacks declined from 21.3 to 11.8 percent. Between 1972 and 2004, Hispanic status dropout rates have fluctuated considerably but also

---

[13] Because Asian/Pacific Islanders were not identified in earlier CPS collections and because of small sample sizes in some years, trends for Asian/Pacific Islanders are not examined.

have demonstrated a long-term decline, falling from 34.3 to 23.8 percent.[14] Hispanics also experienced a downward trend in status dropout rates in the more recent period between 1990 and 2004.

In 2004, 38.4 percent of Hispanic 16- through 24-year-olds born outside of the United States were high school status dropouts (table 6). Hispanics born in the United States were less likely than immigrant Hispanics to be dropouts (14.7 and 13.7 percent for first generation and second generation or higher, respectively[15]). Regardless of recency of immigration, Hispanic youth were more likely to be dropouts than non-Hispanic youth.[16]

Approximately 6 percent of 16- through 24-year-olds who self-identified as being more than one race in 2004 were status dropouts, a rate lower than that of Hispanics and Blacks, but not measurably different from the rates for Whites (6.8 percent) and Asian/Pacific Islanders (3.6 percent) (table 6).[17]

- **Status dropout rates by age:** As might be expected, people ages 16 and 17 had lower status dropout rates in 2004 than 18- through 24-year-olds, at least in part because most 16- and 17-year-olds were still actively pursuing a high school diploma (table 6).[18]

- **Status dropout rates by region:** In 2004, the West and the South had higher status dropout rates (12.2 percent and 11.4 percent, respectively) than the Northeast and Midwest (8.8 percent and 8.0 percent, respectively) (table 6).

The West and the South also contained disproportionately high percentages of the country's status dropouts. In 2004, while 22.7 percent of 16- through 24-year-olds lived in the West, 26.9 percent of all status dropouts lived there. Similarly, 35.3 percent of 16- through 24-year-olds lived in the South compared with 39.1 percent of status dropouts. In contrast, the Midwest was home to roughly 23.0 percent of the 16- through 24-year-old population and 17.8 percent of all status dropouts. Similarly, 19.0 percent of 16- through 24-year-olds lived in the Northeast but 16.3 percent of status dropouts lived there. As discussed earlier in this section, it is not appropriate to consider these rates as reflecting the performance of schools in each of the regions.

National Status Completion Rates

The status completion rate indicates the percentage of young people who have left high school and who hold a high school credential. The rate reported here is based on CPS data and

---

[14] The variable nature of the Hispanic status rate reflects, in part, the small sample of Hispanics in the CPS.

[15] Individuals defined as "first generation" were born in the 50 states or the District of Columbia, and one or both of their parents were born outside the 50 states or the District of Columbia. Individuals defined as "second generation or higher" were born in the 50 states or the District of Columbia, as were both of their parents.

[16] Additional tables available at http://nces.ed.gov/pubsearch/pubsinfo.asp?pubid=2007024 present more information about status dropout rates among Hispanic immigrants, including information about English proficiency and enrollment in U.S. schools.

[17] Due to a small sample size, the standard error for students who identify with more than one race is relatively large, which makes the detection of statistically significant differences difficult.

[18] In 2004, the Current Population Survey shows high school enrollment rates by age group were 94.4 percent for 16-year-olds, 89.1 percent for 17-year-olds, 28.1 percent for 18-year-olds, 5.2 percent for 19-year-olds, and 1.0 percent for 20- through 24-year-olds (estimates not shown in tables).

represents the percentage of 18- through 24-year-olds who are not enrolled in high school and who have earned a high school diploma or equivalent credential, including a GED. The status completion rate includes individuals who may have completed their education outside of the United States, so the rate is not suited for measuring the performance of the education system in this country.

- **National status completion rates:** In 2004, some 86.8 percent of 18- through 24-year-olds not enrolled in high school had received a high school diploma or equivalency credential (table 9).[19] The status completion rates have increased over the last three decades (figure 3 and table 10). Between 1972 and 1990, status completion rates increased by 2.8 percentage points, from 82.8 percent in 1972 to 85.6 percent in 1990. Between 1990 and 2004, status completions rates increased again, from 85.6 percent to 86.8 percent.

- **National estimate of 18- through 24-year-olds with diplomas:** The status completion rate reported above includes students who earned an equivalency credential. However, differences between GED recipients and diploma recipients suggest that GED holders fare significantly worse than diploma holders in terms of income and completing postsecondary education (Tyler 2003). Because the method of high school completion is of interest, data from the GED Testing Service (GEDTS) were used to estimate the number of 18- through 24-year-olds in 2004 who had passed the GED exam. This information was then used to estimate the percentage of individuals ages 18–24 with a regular high school diploma. The results indicate approximately 1.7 million 18- through 24-year-olds in 2004 had passed the GED exam (data not shown in tables).[20] This represented 6.3 percent of people in this age range who were no longer in elementary or secondary school. Subtracting this percentage from the 2004 status completion rate of 86.8 percent suggests that approximately 80.5 percent of this age group held a regular diploma.[21]

- **Status completion rates by sex:** Females ages 18–24 who were not enrolled in high school in 2004 were more likely than males to have completed high school (88.8 versus 84.9 percent) (table 9).

- **Status completion rates by race/ethnicity:** In 2004, among 18- through 24-year-olds not currently enrolled in high school, Asian/Pacific Islanders had a higher status completion rate (95.1 percent) than Whites, Blacks, and Hispanics (91.7 percent, 83.4 percent, and 69.8 percent, respectively) (table 9). In addition, Whites and individuals who identified as more than one race (93.1 percent) were more likely than their Black or Hispanic peers to have completed high school. The status completion rate for Blacks was higher than the rate for Hispanics.

---

[19] Considering all 18- through 24-year-olds, irrespective of enrollment status, 82.5 percent held a high school credential in October 2004 (estimates not shown in tables).

[20] These 1.7 million persons who were 18–24 years old in 2004 passed the GED exam between the years 1998 and 2004.

[21] See Appendix A of this report for details of this calculation.

Status completion rates for both Whites and Blacks increased between 1972 and 1990, and again between 1990 and 2004 (figure 3 and table 11). Between 1972 and 1990, the status completion rates for Hispanics exhibited no general pattern, but since 1990 they have increased, from 59.1 percent to 69.8 percent in 2004.

In 2004, approximately half of foreign-born Hispanics ages 18–24 who were not currently enrolled in high school had completed high school (54.7 percent) (table 9). Status completion rates were higher for Hispanics born in the United States (80.8 percent for first generation and 82.0 percent for second or higher generations), although in each immigrant category Hispanics were less likely to have earned a high school credential than non-Hispanics.

- **Status completion rates by region:** Consistent with status dropout data by region, 18-through 24-year-olds in the West and South had a lower status completion rate (84.4 percent and 85.5 percent, respectively) than their contemporaries in the Midwest and Northeast (89.7 percent and 88.7 percent, respectively) (table 9). Again, it is not appropriate to consider these rates as reflecting the performance of schools in each of the regions.

Averaged Freshman Graduation Rates for Public School Students

The averaged freshman graduation rate (AFGR) provides an estimate of the percentage of public high school students who graduate on time—that is, 4 years after starting 9th grade—with a regular diploma. The rate uses aggregate student enrollment data to estimate the size of an incoming freshman class and aggregate counts of the number of diplomas awarded 4 years later. The incoming freshman class size is estimated by summing the enrollment in 8th grade for 1 year, 9th grade for the next year, and 10th grade for the year after and then dividing by 3. The averaging is intended to account for higher grade retentions in the 9th grade. Although not as accurate as an on-time graduation rate computed from a cohort of students using student record data, this estimate of an on-time graduation rate can be computed with currently available data. The AFGR was selected from a number of alternative estimates that can be calculated using cross-sectional data based on a technical review and analysis of a set of alternative estimates (Seastrom et al. 2006a, 2006b). AFGR estimates are based on the Common Core of Data, State Nonfiscal Survey of Public Elementary/Secondary Education, with ungraded enrollments distributed proportionally to reported enrollments by grade (Seastrom et al. 2006c).[22] This report presents state AFGR estimates for the 2003–04 school year.[23]

---

[22] Similar data are available in the CCD district level nonfiscal files. These files provide more demographic information about students, but are incomplete. NCES is studying imputation strategies for the district-level data that may result in somewhat different state-level estimates than presented in this report.

[23] These AFGR rates were reported in a previous NCES report (Seastrom et al. 2006c). They are included here in order to present a number of completion indicators together in one report.

- **National averaged freshman graduation rate for public school students:** The averaged freshman graduation rate in 2003–04 among public school students for the 48 reporting states and the District of Columbia was 75.0 percent (table 12). When an adjusted national rate is calculated using estimates for the two missing states, New York and Wisconsin, the rate is 74.3 percent.[24]

- **State averaged freshman graduation rates for public school students:** For the class of 2003–04, the averaged freshman graduation rate ranged from 57.4 percent in Nevada to 87.6 percent in Nebraska (table 12). Fifteen states had rates of 80.0 percent or higher—Connecticut, Idaho, Illinois, Iowa, Minnesota, Missouri, Montana, Nebraska, New Jersey, North Dakota, Ohio, Pennsylvania, South Dakota, Utah, and Vermont. Eleven states and the District of Columbia had rates below 70.0 percent—Alabama, Alaska, Arizona, Florida, Georgia, Louisiana, Mississippi, Nevada, New Mexico, South Carolina, and Tennessee.

- **Changes in rates from 2001–02 to 2003–04:** Comparing the averaged freshman graduation rate among public school students for the 3 most recent years for which data are available, the rate increased from 72.6 percent in 2001–02 to 73.9 percent in 2002–03, and increased again to 74.3 percent[25] in 2003–04 (table 13). Of the 48 states with data for both the 2001–02 and 2003–04 school years, 43 experienced an increase in their rate over this period, with 15 increasing by 3 percentage points or more. Tennessee registered the highest increase (6.5 percentage points). Five states and the District of Columbia experienced declines, with three of these states and the District of Columbia experiencing a decline of less than 1 percentage point. The rates for Arizona and Nevada declined by 8 and 15 percentage points, respectively.

---

[24] This 2003–04 adjusted national AFGR rate was calculated using the 2002–03 averaged freshman graduation rates for New York and Wisconsin, the two states missing diploma counts in 2003–04. Thus, this adjusted national rate assumes no change in New York and Wisconsin's averaged freshman graduation rates between 2002–03 and 2003–04.

[25] For this comparison the 2003–04 adjusted national rate of 74.3 is used. This adjusted rate was calculated using the 2002–03 rates for New York and Wisconsin, two states with missing diploma counts data in 2003–04.

Figures

Figure 1. Event dropout rates of 15- through 24-year-olds who dropped out of grades 10–12, by family income: October 1972 through October 2004
Percent

NOTE: The event dropout rate indicates the percentage of youth ages 15 through 24 who dropped out of grades 10–12 in the 12 months between one October and the next (e.g., October 2002 to October 2003). Dropping out is defined as leaving school without a high school diploma or equivalent credential (for example, a General Education Development certificate). Low income is defined as the bottom 20 percent of all family incomes for the year; middle income is between 20 and 80 percent of all family incomes; and high income is the top 20 percent of all family incomes. Data on family income are missing for 1974. Estimates beginning with 1987 reflect new editing procedures for cases with missing data on school enrollment items. Estimates beginning with 1992 reflect new wording of the educational attainment item. Estimates beginning with 1994 reflect changes due to newly instituted computer-assisted interviewing. For details about changes in CPS over time, please see Kaufman, P., Alt, M., and Chapman, C. (2004). *Dropout Rates in the United States: 2001* (NCES 2005-046).
SOURCE: U.S. Department of Commerce, Census Bureau, Current Population Survey (CPS), October 1972–2004.

Figure 2. Status dropout rates of 16- through 24-year-olds, by race/ethnicity: October 1972 through October 2004

Percent

NOTE: The status dropout rate indicates the percentage of 16–24 year-olds who are not enrolled in high school and who lack a high school diploma or equivalent credential such as a General Education Development (GED) certificate. Beginning in 2003, respondents were able to identify themselves as being more than one race. The 2003 and 2004 categories for White, non-Hispanic and Black, non-Hispanic contain only respondents who indicated just one race. The Hispanic category includes Hispanics of all races and racial combinations. Due to small sample size for some or all of the years shown in the figure, American Indians/Alaska Natives and Asian/Pacific Islanders are included the totals but not shown separately. The "more than one race" category is also included in the total in 2003 and 2004 but not shown separately due to small sample size. The variable nature of the Hispanic status rates reflects, in part, the small sample size of Hispanics in the CPS. Estimates beginning with 1987 reflect new editing procedures for cases with missing data on school enrollment items. Estimates beginning with 1992 reflect new wording of the educational attainment item. Estimates beginning with 1994 reflect changes due to newly instituted computer-assisted interviewing. For details about changes in CPS over time, please see Kaufman, P., Alt, M., and Chapman, C. (2004). *Dropout Rates in the United States: 2001* (NCES 2005-046).
SOURCE: U.S. Department of Commerce, Census Bureau, Current Population Survey (CPS), October 1972–2004.

Figure 3. Status completion rates of 18- through 24-year-olds not currently enrolled in high school or below, by race/ethnicity: October 1972 through October 2004
NOTE: Status completion rates measure the percentage of 18–24 year-olds who have left high school and who also hold a high school credential. High school credentials include regular diplomas and alternative credentials such as GEDs. Beginning in 2003 respondents were able to identify themselves as being more than one race. The 2003 and 2004 categories for White, non-Hispanic and Black, non-Hispanic contain only respondents who indicated just one race. The Hispanic category includes Hispanics of all races and racial combinations. Due to small sample size for some or all of the years shown in the figure, American Indians/Alaska Natives and Asian/Pacific Islanders are included the totals but not shown separately. The "more than one race" category is also included in the total in 2003 and 2004 but not shown separately due to small sample size. The variable nature of the Hispanic status rates reflects, in part, the small sample size of Hispanics in the CPS. Estimates beginning with 1987 reflect new editing procedures for cases with missing data on school enrollment items. Estimates beginning with 1992 reflect new wording of the educational attainment item. Estimates beginning with 1994 reflect changes due to newly instituted computer-assisted interviewing. For details about changes in CPS over time, please see Kaufman, Alt, and Chapman (2004). *Dropout Rates in the United States: 2001* (NCES 2005-046).

Tables

Table 1. Event dropout rates and number and distribution of 15- through 24-year-olds who dropped out of grades 10–12, by selected background characteristics: October 2004

Characteristic	Event dropout rate (percent)	Number of event dropouts (thousands)	Population enrolled[1] (thousands)	Percent of all dropouts	Percent of population enrolled
Total	4.7	486	10,385	100.0	100.0
Sex					
Male	5.1	266	5,252	54.7	50.6
Female	4.3	220	5,133	45.3	49.4
Race/ethnicity[2]					
White, non-Hispanic	3.7	245	6,649	50.4	64.0
Black, non-Hispanic	5.7	84	1,476	17.3	14.2
Hispanic	8.9	138	1,546	28.3	14.9
Asian/Pacific Islander, non-Hispanic	1.2 !	5 !	422	1.1 !	4.1
More than one race	4.9 !	11 !	215	2.2 !	2.1
Family income[3]					
Low income	10.4	136	1,303	28.0	12.5
Middle income	4.6	273	5,987	56.1	57.7
High income	2.5	77	3,095	15.9	29.8
Age[4]					
15–16	4.0	128	3,165	26.3	30.5
17	3.1	108	3,513	22.1	33.8
18	4.1	109	2,647	22.4	25.5
19	7.6	58	762	11.9	7.3
20–24	28.2	84	298	17.3	2.9
Region					
Northeast	3.8	77	2,055	15.9	19.8
Midwest	3.1	77	2,504	15.8	24.1
South	5.4	189	3,475	38.9	33.5
West	6.1	143	2,351	29.4	22.6

! Interpret data with caution. Due to relatively large standard errors, estimates are unstable.

[1] This is an estimate of the population of 15- through 24-year-olds enrolled during the previous year in high school based on the number of students still enrolled in the current year and the number of students who either graduated or dropped out the previous year.

[2] Beginning in 2003, respondents were able to identify themselves as being "more than one race." The White, non-Hispanic; Black, non-Hispanic; and Asian/Pacific Islander, non-Hispanic categories consist of individuals who considered themselves to be one race and who did not identify as Hispanic. Non-Hispanics who identified as multiracial are included in the "more than one race" category. The Hispanic category consists of Hispanics of all races and racial combinations. Due to small sample size, American Indians/Alaska Natives are included in the total but are not shown separately.

[3] Low income is defined as the bottom 20 percent of all family incomes for 2004; middle income is between 20 and 80 percent of all family incomes; and high income is the top 20 percent of all family incomes.

[4] Age when a person dropped out may be 1 year younger, because the dropout event could occur at any time over a 12-month period.

NOTE: The event dropout rate indicates percentage of youth ages 15 through 24 who dropped out of grades 10–12 between one October and the next (e.g., October 2003 to October 2004). Dropping out is defined as leaving school without a high school diploma or equivalent credential such as a General Educational Development (GED) certificate. Detail may not add to totals because of rounding.

Virginia[2]	4.8	5.2	4.7	4.6	4.8	4.5	3.9	3.5	2.9
Washington	—	—	—	—	—	—	—	—	7.1
West Virginia	3.8	4.2	3.8	4.1	4.1	4.9	4.2	4.2	3.7
Wisconsin[2]	3.1	2.7	2.4	2.7	2.8	1.8	2.6	2.3	1.9
Wyoming[2]	6.5	6.7	5.7	6.2	6.4	5.1	5.7	6.4	5.8

— Not available. These states do not report dropouts that are consistent with the NCES definition.

[1] These states used an alternative calendar for each year shown, reporting students who drop out between one July and the next. The rates from both calendar approaches are comparable (see Winglee et al. 2000).

[2] The following states reported data using the alternative calendar in the years indicated: Alaska (1995–96, 1999–2000, 2000–01, and 2001–02), Hawaii (2000–01), Idaho (1993–94 through 1998–99), Ohio (1993–94), Oklahoma (1993–94 through 2000–01), South Dakota (1993–94 through 1998–99), Virginia (1993–94 through 1999–2000), Wisconsin (1993–94 through 1996–97 and 1998–99), and Wyoming (1993–94).

[3] Effective in the 1995–96 school year, Louisiana changed its dropout data collection from school-level aggregate counts reported to districts to an individual student-record system. The apparent increase in the dropout rate is partly due to the resulting increased ability to track students.

NOTE: These event dropout rate measures the percentage of public school students in grades 9–12 who dropped out of school between one October and the next (e.g., October 2001 to October 2002). Data are reported by states to the U.S. Department of Education, National Center for Education Statistics. Common Core of Data (CCD) includes public school students only. For event dropout rates by state for the 1991–92 through 1992–93 school years, see Young, B. (2003), *Public High School Dropouts and Completers from the Common Core of Data: School Year 2000–01* (NCES 2004-310). Some estimates differ from previously published reports because of updates to the estimates.

SOURCE: U.S. Department of Education, National Center for Education Statistics, Common Core of Data (CCD), "Local Education Agency Universe Survey Dropout and Completion Data File: School Years 1991–92 through 1996–97" Version 1a and "Local Education Agency Universe Survey Dropout and Completion Data File" School Years 1997–98, 1998–99, 1999–2000, 2000–01, Versions 1b, and 2001–02 Version 0d. The data in the 2001–02 Version 0d file are preliminary data.

Table 6. Status dropout rates and number and distribution of dropouts of 16- through 24-year-olds, by selected background characteristics: October 2004

Characteristic	Status dropout rate (percent)	Number of status dropouts (thousands)	Population (thousands)	Percent of all dropouts	Percent of population
Total	10.3	3,766	36,504	100	100
Sex

Non-Hispanic	8.0	2,087	26,168	55.4	71.7
Region					
Northeast	8.8	613	6,938	16.3	19.0
Midwest	8.0	669	8,400	17.8	23.0
South	11.4	1,471	12,871	39.1	35.3
West	12.2	1,012	8,294	26.9	22.7

[1] Beginning in 2003, respondents were able to identify themselves as being "more than one race." The White, non-Hispanic; Black, non-Hispanic; and Asian/Pacific Islander, non-Hispanic categories consist of individuals who considered themselves to be one race and who did not identify as Hispanic. Non-Hispanics who identified as multiracial are included in the "more than one race" category. The Hispanic category consists of Hispanics of all races and racial combinations. Due to small sample size, American Indians/Alaska Natives are included in the total but are not shown separately.

[2] Individuals defined as "first generation" were born in the 50 states or the District of Columbia, and one or both of their parents were born outside the 50 states or the District of Columbia. Individuals defined as "second generation or higher" were born in the 50 states or the District of Columbia, as were both of their parents.

NOTE: The status dropout rate indicates the percentage of 16- through 24-year-olds who are not enrolled in high school and who lack a high school credential. High school credential includes a high school diploma or equivalent credential such as a General Educational Development (GED) certificate. Detail may not add to totals because of rounding.

SOURCE: U.S. Department of Commerce, Census Bureau, Current Population Survey (CPS), October 2004.

Table 7. Status dropout rates, number of status dropouts, and population of 16- through 24-year-olds: October 1972 through October 2004

Year[1]	Status dropout rate (percent)	Number of status dropouts (thousands)	Population (thousands)
1972	14.6	4,769	32,643

[1] Estimates beginning in 1987 reflect new editing procedures for cases with missing data on school enrollment items. Estimates beginning in 1992 reflect new wording of the educational attainment item. Estimates beginning in 1994 reflect changes due to newly instituted computer-assisted interviewing. For details about changes in the Current Population Survey (CPS) over time, please see Kaufman, P., Alt, M., and Chapman, C. (2004). *Dropout Rates in the United States: 2001* (NCES 2005-046).
NOTE: Status completion rates measure the percentage of 18- through 24-year-olds who are not enrolled in high school and who also hold a high school diploma or equivalent credential such as a General Educational Development (GED) certificate. Those still enrolled in high school are excluded from the analysis.
SOURCE: U.S. Department of Commerce, Census Bureau, Current Population Survey (CPS), October 1972–2004.

Table 11. Status completion rates of 18- through 24-year-olds not currently enrolled in high school or below, by sex and race/ethnicity: October 1972 through October 2004

Year[1]	Total (percent)	Sex (percent)		Race/ethnicity (percent)[2]		
		Male	Female	White, non-Hispanic	Black, non-Hispanic	Hispanic
1972	82.8	83.0	82.7	86.0	72.1	56.2
1973	83.7	84.0	83.4	87.0	71.6	58.7

[1] Estimates beginning in 1987 reflect new editing procedures for cases with missing data on school enrollment items. Estimates beginning in 1992 reflect new wording of the educational attainment item. Estimates beginning in 1994 reflect changes due to newly instituted computer-assisted interviewing. For details about changes in the Current Population Survey (CPS) over time, please see Kaufman, P., Alt, M., and Chapman, C. (2004). *Dropout Rates in the United States: 2001* (NCES 2005-046).

[2] Beginning in 2003, respondents were able to identify themselves as being "more than one race." The 2003 White, non-Hispanic and Black, non-Hispanic categories consist of individuals who considered themselves to be one race and who did not identify as Hispanic. The Hispanic category includes Hispanics of all races and racial combinations. Due to small sample size for some or all of the years shown in the table, American Indians/Alaska Natives and Asian/Pacific Islanders are included the totals but not shown separately. The "more than one race" category is also included in the total in 2003 and 2004 but not shown separately due to small sample size.

NOTE: Status completion rates measure the percentage of 18- through 24-year-olds who are not enrolled in high school and who also hold a high school diploma or equivalent credential such as a General Educational Development (GED) certificate. Those still enrolled in high school are excluded from the analysis.

— Not available.

[1] First-time 9th-graders were estimated as the average of student membership in grades 8, 9, and 10 in three consecutive years.

[2] The national estimate does not include data from two states with missing diploma counts: New York and Wisconsin. The adjusted national rate with estimates for these two states included is 74.3 percent.

NOTE: The averaged freshman graduation rate provides an estimate of the percentage of public high school students who graduate with a regular diploma 4 years after starting 9th grade. The rate uses aggregate student enrollment data to estimate the size of an incoming freshman class and aggregate counts of the number of diplomas awarded 4 years later. Ungraded students were allocated to individual grades.

— Not available.

[1] The national estimate does not include data from two states with missing diploma counts: New York and Wisconsin. When the national estimate is adjusted to account for missing information for these two state by using the 2002–03 rates for these states, the adjusted national rate is 74.3 percent.

NOTE: The averaged freshman graduation rate provides an estimate of the percentage of public high school students who graduate with a regular diploma 4 years after starting 9th grade. The rate uses aggregate student enrollment data to estimate the size of an incoming freshman class and aggregate counts of the number of diplomas awarded 4 years later. The incoming freshman class size is estimated by summing the enrollment in 8th grade for one year, 9th grade for the next year, and 10th grade for the year after and then dividing by 3. For this table, enrollments for school years 1997–99 through 2001–02 and diploma recipients for school years 2001–02, 2002–03, and 2003–04 were used. Ungraded students were allocated to individual grades.

Appendix A—Technical Notes and Glossary

Common Core of Data

The Common Core of Data (CCD), administered by the National Center for Education Statistics (NCES), is an annual survey of the state-level education agencies in the 50 states, the District of Columbia, and seven other jurisdictions.[1] Through this survey, statistical information is collected on all public school districts and their schools, staff, students, and finances. Information is not collected on private schools and their students, homeschoolers, individuals who never attended school in the United States, and those who have been out of a public school system for more than a year.

The dropout data collection was initiated with a set of instructions to state CCD coordinators in the summer of 1991. Those instructions specified the details of dropout data to be collected during the 1991–92 school year. Dropouts are reported for the preceding school year. The 1991–92 data were submitted to NCES as a component of the 1992–93 CCD data collection. The 2001–02 dropout data were submitted as a component of the 2002–03 CCD data collection. For the 2001–02 school year, a total of 49 states submitted dropout data to the CCD. Of these, 46 reported using agreed-upon reporting definitions. Those that did not were excluded from the CCD dropout data. Because of these exclusions, CCD data cannot be used to estimate a national-level dropout rate.

Data needed to estimate the averaged freshman graduation rate, specifically data on diploma awards and enrollment by grade, have traditionally been part of the CCD data collection. Like dropout data, diploma recipient reports are lagged a year (e.g., 2002–03 diploma counts are in the 2003–04 data files). All states reported diploma and enrollment data necessary for calculating the averaged freshman graduation rate, with the exception of diploma counts for 2003–04 for New York and Wisconsin.

---

[1] Dropout data presented in this report are drawn from CCD Local Education Agency Universe Survey Dropout and Completion Data Files for school years 1991–92 through 1996–97 Version 1a, for school years 1997–98 through 2000–01 Version 1b, and for 2001–02 Version 0d. Data for AFGR estimates are based on the Common Core of Data: State Non-Fiscal Data Files, 1997–98 Version 1b, 1998–99 Version 1c, 1999–2000 Version 1c, 2000–01 Version 1b, 2001–02 Version 1b, 2002–03 Version 1b, 2003–04 Version 0c, and 2004–05 Version 0c.

Defining and Calculating Event Dropout Rates Using the CCD

The definition of "event dropout rates" that was agreed upon by NCES and the states was the following:

The denominator of the rate is the October 1st membership count for the state for the grades for which the dropout rate is being calculated. For example, the dropout rate for grades 9 through 12 would use a denominator that equals the October 1st enrollment count for grades 9 through 12.

The numerator (dropouts) is all individuals who

- were enrolled in school at some time during the previous school year;
- were not enrolled at the beginning of the current school year;
- have not graduated from high school or completed a state- or district-approved education program; and
- do not meet any of the following exclusionary conditions: transferred to another public school district, private school, or state- or district-approved education program; temporary absence due to suspension or school-approved education program; or death.

For the purpose of this definition

- the school year is the 12-month period of time from the first day of school (operationally set as October 1), with dropouts from the previous summer reported for the year and grade in which they fail to enroll;
- individuals who are not accounted for on October 1 are considered dropouts; and
- an individual has graduated from high school or completed a state- or district-approved education program upon receipt of formal recognition from school authorities. A state- or district-approved education program may consist of special education and district- or state-sponsored GED preparation.

NCES is currently considering options for imputing missing dropout data. If implemented, the imputations may result in somewhat different estimates of dropout rates than presented in this report.

Defining the Averaged Freshman Graduation Rate for Public School Students Using the CCD

Data from the state nonfiscal CCD files are used to calculate averaged freshman graduation rates in this report. Graduates include only diploma recipients in this indicator. Other diploma recipients, such as those who earn a certificate of attendance, and those awarded high school equivalency credentials such as GEDs are not considered graduates. The purpose of these

exclusions is to make the averaged freshman graduation rate as similar as possible conceptually to Adequate Yearly Progress provisions in the No Child Left Behind Act (NCLB) of 2001 (P.L. 107-110). These provisions require measurement of on-time graduation from public high schools, and explicitly exclude GEDs and other types of non-regular diplomas. Another reason for the exclusion of equivalency credentials in the averaged freshman graduation rate is that not all states report giving equivalency credentials, so comparable estimates across states would not be possible.

Diploma recipients

These are individuals who are awarded, in a given year, a high school diploma or a diploma that recognizes some higher level of academic achievement. They can be thought of as students who meet or exceed the coursework and performance standards for high school completion established by the state or other relevant authorities. State and local policies and data collection administration can have profound effects on the numbers of diploma recipients reported by a state. There are differences in what a high school diploma represents in different states. Some states award regular diplomas to all students who meet completion requirements, regardless of the extent to which these requirements address state or district academic standards. Other states award some form of alternative credential to students who meet some, but not all, requirements.

Exclusion of other high school completers

Other high school completers were excluded from the calculation of AFGR. These individuals receive a certificate of attendance or some other credential in lieu of a diploma. One example of such a credential is a certificate of attendance for special education students who do not address the regular academic curriculum. Students awarded this credential typically meet requirements that differ from those for a high school diploma. Some states do not issue an "other high school completion" type of certificate, but award all students who complete school a diploma regardless of what academic requirements the students have met.

Exclusion of high school equivalency recipients

High school equivalency recipients are awarded a credential certifying that they have met state or district requirements for high school completion by passing an examination or completing some other performance requirement. High school equivalency credentials, such as those earned by passing the GED test, are generally considered valid completion credentials, but recipients of such credentials are excluded from the averaged freshman graduation rate because

No Child Left Behind called for only diploma recipients to be counted and because not all states report high school equivalency counts on the CCD.

Averaged freshman graduation rate

The averaged freshman graduation rate provides an estimate of the percentage of high school students who graduate on time. The rate uses aggregate student enrollment data to estimate the size of an incoming freshman class and aggregate counts of the number of diplomas awarded 4 years later. The incoming freshman class size is estimated by summing the enrollment in 8th grade in one year, 9th grade for the next year, and 10th grade for year after and then dividing by 3. The averaging is intended to account for higher grade retentions in the 9th grade. Although not as accurate as an on-time graduation rate computed from a cohort of students using student record data, this estimate of an on-time graduation rate can be computed with currently available data. The AFGR was selected from a number of alternative estimates that can be calculated using cross-sectional data based on a technical review and analysis of a set of alternative estimates (Seastrom et al. 2006b). The rate for the class of 2003–04 was calculated in the following manner:

$$\frac{\textit{High School Diplomas Awarded End of 2003–04 School Year}}{\textit{Enrollment in (Grade 8 in fall 1999 + Grade 9 in fall 2000 + Grade 10 in fall 2001)/3}}$$

Although enrollments are reported by grade, some states report ungraded students. To adjust for this, an allocation procedure used in the Common Core of Data "Local Education Agency Universe Survey Dropout and Completion Data" file was applied. Through this process the data for ungraded enrollment counts were redistributed across grades in proportion to the graded enrollment of the state, and the resulting estimates for grades 8, 9, and 10 were added to the reported enrollment counts for those grades. For the 2003–04 school year, the averaged freshman graduation rate for public schools in the United States for the 48 reporting states and the District of Columbia is based on the 2,548,128 diploma recipients reported for school year 2003–04, divided by the average of the 3,261,969 8th-grade student enrollment reported for October 1999–2000, the 3,669,077 9th-grade student enrollment reported for October 2000–2001, and the 3,259,701 10th-grade student enrollment reported for October 2001–02. The 2,548,128 public school diploma recipients divided by the 3,396,916 averaged number of public school freshmen, multiplied by 100, results in a 2003–04 public school graduation rate for the United States of 75.0 percent. The same formula is applied to compute state-level AFGR in 2003–04, and for national and state rates in 2001–02 and 2002–03. To produce an adjusted

2003–04 national rate using estimates for the two states missing diploma counts for that year (New York and Wisconsin), the 2002–03 AFGR rates for these states were used to estimate the number of diplomas received in 2003–04 in these states. More demographic information about students is available on the district-level nonfiscal CCD data files. However, the district level data are incomplete, so additional demographic information about graduates is not shown in this report. NCES is evaluating different options for imputing these missing data so that more detailed analyses by demographic characteristics can be undertaken. Once imputations are complete, state level totals from the imputed data may differ somewhat from rates based on the state level data shown here.

Note that the rate is not the same as a true cohort graduation rate that shows the proportion of actual first-time 9th-grade students who graduated within 4 years of starting 9th grade. A true cohort rate requires data that track a given set of students over time. The CCD data used for the averaged freshman graduation rate are collected using repeating cross-sectional surveys. Individual students are not followed from year to year. Although the averaged freshman graduation rate was selected as the best of the available alternatives, there are several factors that make it fall short of a true on-time graduation rate. First, the averaged freshman class is, at best, an approximation of the actual number of first-time freshmen. To the extent that the averaging differs from actual net transfers into and out of a class, and to the extent that it does not accurately capture grade retention and dropout rates across all 4 years of a given freshman class's expected high school stay, the estimate will be wrong.

Second, by including all graduates in a specific year, the graduates may include students who repeated a grade in high school or completed high school early and, thus, are not on-time graduates in that year.

Taking these factors one at a time, it is possible that more high school students will move out of a given jurisdiction than move into it during the 4 years between the beginning of 9th grade and the expected graduation date. The averaged freshman count would overestimate the size of the actual cohort and thus underestimate the graduation rate. On the other hand, if more high school students moved into a jurisdiction than moved out during this 4-year period, the averaged freshman count would underestimate the size of the cohort and thus overestimate the graduation rate. Similarly, the use of 8th-, 9th-, and 10th-grade enrollment counts to estimate a first-time freshman class may not work as intended in many situations. Using 8th- and 9th-grade enrollment counts can be inaccurate to the extent that they do not adequately account for grade retention at 9th grade. Retention rates at 9th grade tend to be relatively large. While adding 8th-grade enrollments to the average may help diminish this problem, it is likely that in many cases it will not wholly adjust for actual 9th-grade retention rates, thus overestimating the first-time

freshman count and underestimating the graduation rate. Using 9th- and 10th-grade enrollment numbers can be inaccurate to the extent that the 10th-grade counts exclude 9th-graders who dropped out from the previous year (effectively underestimating the cohort) or include students retained in 10th grade (effectively overestimating the cohort).

The inclusion of graduates who spent more or less than 4 years in high school increases the number of graduates in the numerator and yields a higher estimated rate than would be the case if only on-time graduates were included in the numerator. On the other hand, not recording early graduates with their actual cohort decreases the graduation rate for a class.

Data Considerations for CCD

As a universe data collection, the CCD does not have sampling errors (the difference between an estimate based on a sample and the estimate based on an entire population). However, there are potential sources for nonsampling errors in universe data collections, including inability to get information about all cases (i.e., nonresponse), definitional difficulties, respondent inability to provide correct information, and errors made in recording, coding, and processing data.

Current Population Survey

The Current Population Survey (CPS) provides nationally representative data for the civilian, noninstitutionalized population of the United States. The survey is conducted in a sample of 50,000–60,000 households each month. Households are interviewed for 4 successive monthly interviews, are not interviewed for the next 8 months, and then are re-interviewed for the following 4 months. Typically, the 1st and the 5th interviews are conducted in person, with the remaining conducted via computer-assisted telephone interviewing. The sample frame is a complete list of dwelling-unit addresses at the time of the decennial Census updated by demolitions and new construction and field listings. The population surveyed excludes members of the armed forces, inmates of correctional institutions, and patients in long-term medical or custodial facilities; it is referred to as the civilian, noninstitutionalized population. For the October 2004 core CPS, the unweighted response rate was 92.3 percent, and the unweighted response rate for the school enrollment supplement was 96.0 percent. Because the school enrollment supplement is dependent on the core collection, the overall unweighted response rate for the supplement is the product of core and supplement response rates, or 88.6 percent in 2004.

An adult member of each household serves as the informant for that household, supplying basic monthly data for each member of the household. In addition, in October of each year,

supplementary questions regarding school enrollment are asked about eligible household members 3 years old and over. Data are collected about individuals who attend or attended public schools or private schools, who were homeschooled, or who never attended school in the United States.

CPS data on educational attainment and enrollment status in the current year and prior year are used to identify dropouts and completers, and additional items in the CPS data are used to describe some of their basic characteristics. The CPS is the only source of national time series data on dropout and completion rates. However, because CPS collects no information on school characteristics and experiences, its usefulness in addressing dropout and completion issues is primarily for providing insights on who drops out and who completes. Sample sizes in the CPS collections do not support stable state-level estimates.

There are important differences in data collection procedures between the CPS and CCD.[2] First, the CCD collection includes only data for public school whereas the CPS counts include students who were enrolled in either public or private schools, and some individuals who never enrolled in school in the United States. Second, the CCD collects data about students from a given state's public school system. CPS data are based on where individuals currently reside so the state of residence may differ from the state or country of earlier school attendance. Third, the CCD collection includes dropouts in grades 7 through 12 versus grades 10 through 12 in the CPS (although CCD event rates are reported for grades 9 through 12 as in this report). Fourth, the CCD collection is based on administrative records rather than individual self-reports based on household surveys as in the CPS.

Defining and Calculating Dropout and Completion Rates Using the CPS

Event dropout rates

The October Supplement to the CPS is the only national data source that currently can be used to estimate annual national dropout rates. As a measure of recent dropout experiences, the event dropout rate measures the proportion of students who dropped out over a 1-year interval.

The numerator of the event dropout rate for October 2004 is the number of persons 15 through 24 years old surveyed in 2004 who were enrolled in grades 10–12 in October 2003, were not enrolled in high school in October 2004, and who also did not complete high school (that is,

---

[2] Data in the CCD are based on data from all public schools. Data in the CPS are collected from a sample of households and not the full universe of households. As a result, CPS data have sampling errors associated with estimates whereas CCD data do not. For more information on CPS sampling errors and how to interpret them, see the section "Statistical Procedures for Analyzing CPS-Based Estimates" later in the appendix.

had not received a high school diploma or an alternative credential such as an equivalency certificate) between October 2003 and October 2004.

The denominator of the event dropout rate for 2004 is the sum of the dropouts (that is, the numerator) and all persons 15 through 24 years old who were attending grades 10–12 in October 2003, who were still enrolled in October 2004, or who graduated or completed high school between October 2003 and October 2004.

The dropout interval is defined to include the previous summer (in this case, the summer of 2004) and the previous school year (in the case of the 2003 school year), so that once a grade is completed, the student is then at risk of dropping out of the next grade. Given that the data collection is tied to each person's enrollment status in October of 2 consecutive years, any student who drops out and returns within the 12-month period is not counted as a dropout.

Status dropout rates

The status dropout rate reflects the percentage of individuals who are dropouts, regardless of when they dropped out. The numerator of the status dropout rate for 2004 is the number of individuals ages 16 through 24 years who, as of October 2004, had not completed high school and were not currently enrolled. The denominator is the total number of 16- through 24-year-olds in October 2004. Those who received a GED are not considered dropouts for this rate.

Status completion rates

The numerator of the high school status completion rate is the number of 18- through 24-year-olds who had received a high school diploma or an alternative credential such as an equivalency certificate. The denominator is the number of 18- through 24-year-olds who are no longer in elementary or secondary school.

General education development (GED) credentials and the status completion rate. Prior to 2000, editions of this series of dropout reports presented estimates of overall status completion rates and estimates of the method of completion—graduation by diploma or completion by taking an alternative exam such as the General Educational Development (GED) test. Examination of the changes in the CPS GED items in the October 2000 and subsequent surveys has indicated that GED estimates for 2000 and later years are not comparable with earlier data and may not be reliable estimates of high school equivalency completions (table A-1). Therefore, CPS estimates of the method of high school completion were not presented in some recent dropout reports. Because the method of high school completion remains of interest, an estimate of those who passed the GED exam using GED Testing Service (GEDTS) data was developed.

Table A-1. Number of 18- through 24-year-olds who received a GED, by data source: 1990 through 2004

Year	GED Service[1]	CPS[1,2]	Standard error (CPS)
1990	222,295	111,023	16,728
1991	247,767	117,371	17,197
1992	249,470	107,030	16,425
1993	241,787	107,415	16,455
1994	247,051	211,560	23,047
1995	256,441	237,876	24,424
1996	258,957	312,645	27,957
1997	244,749	286,811	26,793
1998	254,239	340,784	24,790
1999	267,932	320,187	27,331
2000[3]	263,465	90,810	24,831
2001[3]	342,156	107,202	28,249
2002[3]	176,291	70,745	12,111
2002[3]	203,422	80,407	12,878
2002[3]	220,714	94,587	13,937

[1] These numbers represent the total number of General Educational Development (GED) credentials earned by 18- through 24-year-olds in the United States only.

[2] Estimate of the number of GEDs from the Current Population Survey (CPS) may include alternative credentials other than those earned by passing the GED examination.

[3] Reflects changes made to questions about GED receipt introduced in October 2002.

SOURCE: U.S. Department of Education, Census Bureau, Current Population Survey (CPS) (various years); and American Council on Education, GED Testing Service, *GED Statistical Report* , 1990 to 1992, and *Who Took the GED?,* 1993 to 2001, and *Who Passed the GED Tests?,* 2002 to 2004.

Data on GED testing are collected by the GED Testing Service and reported in a series of annual statistical reports (American Council on Education, GED Testing Service 1990 through 2004). These reports indicate the number of people passing the GED test, by age group. Tabulation of data presented in GED Testing Service reports from 1998 through 2004 permits an estimate of the number of persons ages 18–24 in 2004 (the most recent year for which data are available) who ever passed the GED test. The source data from the GEDTS reports are presented in table A-2.

GED Testing Service reports present the number of GED passers[3] in the United States and the percentage of passers in each age group for persons age 16 (or age 16 and under[4]), 17, 18, 19,

---

[3] Passing the GED is a good but imperfect indicator of receiving a high school equivalency credential. Some people who pass the test may not receive the credential because they do not file necessary paperwork or pay necessary fees. People may also leave the country, die, or receive a regular high school diploma after passing the GED test.

[4] The lowest standard minimum age for testing in any state is 16. Some jurisdictions grant exceptions to the minimum age on a case-by-case basis. GED Testing Service reports from the 1996–98 group the small number of individuals under age 16 as 16 years old for reporting purposes.

Table A-2. Percentage distribution of recipients of a GED, by age group 16 and above: 1998 through 2004

Year	Number passed	Age Group					
		16	17	18	19	20–24	25 or over
1998	480,947	2.8	11.8	19.1	12.2	24.1	30.0
1999	498,015	3.3	12.9	16.1	12.3	24.3	31.1
2000	486,997	3.2	13.0	16.5	12.2	24.9	30.2
2001	648,022	2.9	11.5	14.7	11.5	26.4	33.0
2002	329,515	4.4	15.8	17.4	11.6	24.6	26.2
2003	387,470	3.9	14.6	16.8	11.4	25.9	27.4
2004	405,724	4.0	14.0	16.8	11.4	26.2	27.6

NOTE: Data apply to the 50 states and the District of Columbia. The numbers and percentage distributions for 1996–2001 were reported in the original source as the number receiving a credential.
SOURCE: American Council on Education, GED Testing Service, *Who Took the GED?* , 1998 to 2001, and *Who Passed the GED Tests?,* 2002 to 2004.

20–24, and higher age groups. The number of people in 2004 who were ages 18–24 and who passed the GED test equals the sum of the number of people who passed the GED test since 1998 at specific ages. The GEDTS reports present grouped data for persons ages 20–24. As a result, a count of the number of passers at each specific age from 20 through 24 is not available. Analysis of GEDTS data on GED passers from 2001 and 2002 indicates that approximately 8 percent of all GED passers are age 20, 6 percent are age 21, 5 percent are age 22, 4 percent are age 23, and 3 percent are age 24. It was assumed that the distribution of passers ages 20–24 follows this distribution for all years from 1998 through 2004.

Data considerations for CPS

Over the last several decades, data collection procedures, items, and data preparation processes have changed in the CPS. Some of these changes were introduced to ensure CPS estimates were comparable to decennial Census collections, some were introduced to reflect changes in the concepts under study, some were introduced to improve upon measures, and some were introduced to develop measures for new phenomena. The effects of the various changes have been studied to help ensure they did not disrupt trend data from CPS. For a summary of these studies, please see appendix C of *Dropout Rates in the United States: 2001* (Kaufman, Alt, and Chapman 2004).

CPS data include weights to help make estimates from the data representative of the civilian, noninstitutionalized population in the United States. These weights are based on decennial Census data that are adjusted for births, deaths, immigration, emigration, etc., over time.

Imputation for item nonresponse in CPS. For many key items in the October CPS, the U.S. Census Bureau imputes data for cases with missing data due to item nonresponse. However, the Census Bureau did not impute data regarding the method of high school completion before 1997. Special imputations were conducted for these items using a sequential hot deck procedure implemented through the PROC IMPUTE computer program developed by the American Institutes for Research. Three categories of age, two categories of race, two categories of sex, and two categories of citizenship were used as imputation cells.

Age and grade ranges in CPS estimates. The age and grade ranges used in the CPS measures of dropout rates are constrained by available data. Ideally, the estimates would be able to capture reliable estimates of children in grades as low as grade 9. However, the CPS asks the question about enrollment the previous October only about individuals age 15 and older. Many 9th-graders are younger than age 15, so 10th grade was selected as the lower boundary of grade ranges in the event dropout rate.

Accuracy of CPS estimates. CPS estimates in this report are derived from samples and are subject to two broad classes of error—sampling and nonsampling error. Sampling errors occur because the data are collected from a sample of a population rather than from the entire population. Estimates based on a sample will differ somewhat from the values that would have been obtained from a universe survey using the same instruments, instructions, and procedures. Nonsampling errors come from a variety of sources and affect all types of surveys, universe as well as sample surveys. Examples of sources of nonsampling error include design, reporting, and processing errors and errors due to nonresponse. The effects of nonsampling errors are more difficult to evaluate than those that result from sampling variability. As much as possible, procedures are built into surveys in order to minimize nonsampling errors.

The standard error is a measure of the variability due to sampling when estimating a parameter. It indicates how much variance there is in the population of possible estimates of a parameter for a given sample size. Standard errors can be used as a measure of the precision expected from a particular sample. The probability that a sample statistic would differ from a population parameter by less than the standard error is about 68 percent. The chances that the difference would be less than 1.65 times the standard error are about 90 out of 100; and that the difference would be less than 1.96 times the standard error, about 95 out of 100.

Standard errors for percentages and number of persons based on CPS data were calculated using the following formulas:

Percentage:

$$\text{se} \quad = \quad \sqrt{(b/N)(p)(100-p)}$$

where p =   the percentage $(0 < p < 100)$,

                N =   the population on which the percentage is based, and

                b =   the regression parameter based on a generalized variance formula and is associated with the characteristic.
For both 2004, b is equal to 2,131 for the total or White population; 2,410 for the Black population; and 2,744 for the Hispanic population, 2,410 for the Asian/Pacific Islander and "more than one race" populations ages 14 through 24. The b for regional estimates are 0.90 for the Northeast, 0.93 for the Midwest, 1.14 for the South, and 1.14 for the West.

CPS documentation explain the purpose and process for the generalize variance parameter:

> Experience has shown that certain groups of estimates have similar relations between their variances and expected values. Modeling or generalizing may provide more stable variance estimates by taking advantage of these similarities. The generalized variations function is a simple model that expresses the variance as a function of the expected value of a survey estimates. The parameters of the generalized variance function are estimated using direct replicate variances. (Cahoon 2005, p. 7)

Number of persons:

$$se = \sqrt{(bx)(1-(x/T))}$$

where x =   the number of persons (i.e., dropouts),

           T =   population in the category (e.g., Blacks ages 16 through 24), and

           b =   as above.

Statistical Procedures for Analyzing CPS-Based Estimates

Because CPS data are collected from samples of the population, statistical tests are employed to measure differences between estimates to help ensure they are different taking into account possible sampling error. The descriptive comparisons were tested in this report using Student's t statistic. Differences between estimates are tested against the probability of a type I error, or significance level. The significance levels were determined by calculating the Student's t values for the differences between each pair of means or proportions and comparing these with published tables of significance levels for two-tailed hypothesis testing.

Student's t values may be computed to test the difference between percentages with the following formula:

$$t = \frac{P_1 - P_2}{\sqrt{se_1^2 + se_2^2}}$$

---

where P_1 and P_2 are the estimates to be compared and se_1 and se_2 are their corresponding standard errors.

Several points should be considered when interpreting *t* statistics. First, comparisons based on large *t* statistics may appear to merit special attention. This can be misleading since the magnitude of the *t* statistic is related not only to the observed differences in means or proportions but also to the number of respondents in the specific categories used for comparison. Hence, a small difference compared across a large number of respondents would produce a large *t* statistic.

Second, there is a possibility that one can report a "false positive" or type I error. In the case of a *t* statistic, this false positive would result when a difference measured with a particular sample showed a statistically significant difference when there was no difference in the underlying population. Statistical tests are designed to control this type of error. These tests are set to different levels of tolerance or risk known as alphas. The alpha level of .05 selected for findings in this report indicates that a difference of a certain magnitude or larger would be produced no more than one time out of twenty when there was no actual difference in the quantities in the underlying population. When *t* values are smaller than the .05 level, the null hypothesis that there is no difference between the two quantities is rejected. Finding no difference, however, does not necessarily imply the values are the same or equivalent.

Third, the probability of a type I error increases with the number of comparisons being made. Bonferroni adjustments are sometimes used to correct for this problem. Bonferroni adjustments do this by reducing the alpha level for each individual test in proportion to the number of tests being done. However, while Bonferroni adjustments help avoid type I errors, they increase the chance of making type II errors. Type II errors occur when there actually is a difference present in a population, but a statistical test applied to estimates from a sample indicates that no difference exists. Prior to the 2001 report in this series, Bonferroni adjustments were employed. Because of changes in NCES reporting standards, Bonferroni adjustments are not employed in this report.

Regression analysis was used to test for trends across age groups and over time. Regression analysis assesses the degree to which one variable (the dependent variable) is related to one or more other variables (the independent variables). The estimation procedure most commonly used in regression analysis is ordinary least squares (OLS). When studying changes in rates over time, the rates were used as dependent measures in the regressions, with a variable representing time and a dummy variable controlling for changes in the educational attainment item in 1992 (=0 for years 1972 to 1991, =1 after 1992) used as independent variables. When slope coefficients were

positive and significant, rates increased over time. When slope coefficients were negative and significant, rates decreased over time. Because of varying sample sizes over time, some of the observations were less reliable than others (i.e., some years' standard errors were larger than those for other years). In such cases, OLS estimation procedures do not apply, and it is necessary to modify the regression procedures to obtain unbiased regression parameters. Each variable in the analysis was transformed by dividing by the standard error of the relevant year's rate. The new dependent variable was then regressed on the new time variable and new editing-change dummy variable. All statements about trend changes in this report are statistically significant at the .05 level.

Glossary

For dropout and completion rate estimates, please see the discussions above.

Age. Age of the subject at the time of the interview.

Family income. Family income is derived from a single question asked of the household respondent. Income includes money income from all sources including jobs, business, interest, rent, and social security payments. The income of nonrelatives living in the household is excluded, but the income of all family members 14 years old and over, including those temporarily living away, is included. Family income refers to receipts over a 12-month period.

There are several issues that affect the interpretation of dropout rates by family income using the CPS. First, it is possible that the family income of the students at the time they dropped out was somewhat different from their family income at the time of the CPS interview. Furthermore, family income is derived from a single question asked of the household respondent in the October CPS. In some cases, there are persons 15 through 24 years old living in the household who are unrelated to the household respondent, yet whose family income is defined as the income of the family of the household respondent. Therefore, the current family income of the respondent may not accurately reflect that person's family background. In particular, some of the young adults in the 15- through 24-year age range do not live in a family unit with a parent present.

GED, or General Educational Development. General Educational Development (GED) Tests are standardized tests designed to measure the skills and knowledge students normally acquire by the end of high school. The tests are developed by the American

Council on Education's GED Testing Service. People who pass the tests may receive a GED credential.

Geographic regions. There are four Census regions used in this report: Northeast, Midwest, South, and West. The Northeast consists of Maine, New Hampshire, Vermont, Massachusetts, Connecticut, Rhode Island, New York, New Jersey, and Pennsylvania. The Midwest consists of Ohio, Indiana, Illinois, Michigan, Wisconsin, Iowa, Minnesota, Missouri, North Dakota, South Dakota, Nebraska, and Kansas. The South consists of Delaware, Maryland, the District of Columbia, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida, Kentucky, Tennessee, Alabama, Mississippi, Arkansas, Louisiana, Oklahoma, and Texas. The West consists of Montana, Idaho, Wyoming, Colorado, New Mexico, Arizona, Utah, Nevada, Washington, Oregon, California, Alaska, and Hawaii.

Recency of immigration. Recency of immigration was derived from a set of questions on the basic monthly survey inquiring about the country of birth of the reference person, and his or her mother and father. From these questions the following three categories were constructed: (1) born outside the 50 states and District of Columbia, (2) first generation, and (3) second or higher generation. First generation is defined as individuals who were born in one of the 50 states or the District of Columbia, but who had at least one parent who was not. Second or higher generation persons are individuals who themselves, as well as both of their parents, were born in one of the 50 states or the District of Columbia. These three categories were subdivided using the variable for the subject's race/ethnicity (please see below) so that there were six categories: a Hispanic and non-Hispanic category for each of the three immigration categories.

Race/ethnicity. This variable is constructed from two variables. One asks about the subject's ethnic background and the second asks about the subject's race. Those reported as being of Hispanic background on the ethnic background question are categorized as Hispanic irrespective of race. Non-Hispanics are then categorized by race. Beginning in 2003, respondents were able to indicate more than one race. Those who indicated more than one race, and who did not indicate that they were Hispanic, were included in a category labeled "more than one race."

Sex. Sex of the subject.

Table B-10. Standard errors for table 11: Status completion rates of 18- through 24-year-olds not currently enrolled in high school or below, by sex and race/ethnicity: October 1972 through October 2004

| Year | Total | Sex | | Race/ethnicity | | |
		Male	Female	White non-Hispanic	Black non-Hispanic	Hispanic
1972	0.32	0.51	0.48	0.33	1.20	1.83
1973	0.31	0.49	0.47	0.31	1.17	1.83
1974	0.31	0.49	0.46	0.31	1.17	1.70
1975	0.30	0.47	0.46	0.30	1.18	1.72
1976	0.30	0.48	0.45	0.31	1.12	1.68
1977	0.30	0.49	0.45	0.31	1.12	1.66
1978	0.30	0.48	0.45	0.31	1.11	1.61
1979	0.30	0.49	0.45	0.31	1.11	1.58
1980	0.30	0.48	0.43	0.30	1.07	1.51
1981	0.29	0.48	0.43	0.30	1.02	1.46
1982	0.31	0.49	0.45	0.32	1.06	1.57
1983	0.31	0.50	0.45	0.32	1.06	1.59
1984	0.31	0.49	0.45	0.32	0.99	1.54
1985	0.31	0.49	0.44	0.32	1.00	1.58
1986	0.31	0.50	0.45	0.32	0.99	1.51
1987	0.32	0.51	0.47	0.34	0.99	1.47
1988	0.36	0.57	0.51	0.36	1.13	1.78
1989	0.36	0.57	0.51	0.37	1.11	1.73
1990	0.34	0.53	0.50	0.34	1.03	1.54
1991	0.34	0.55	0.50	0.35	1.06	1.53
1992	0.33	0.53	0.49	0.33	1.07	1.53
1993	0.34	0.53	0.50	0.35	1.07	1.49
1994	0.34	0.49	0.45	0.34	1.02	1.43
1995	0.35	0.50	0.47	0.36	1.01	1.40
1996	0.35	0.50	0.48	0.34	1.08	1.49
1997	0.35	0.51	0.47	0.36	1.10	1.42
1998	0.36	0.53	0.47	0.36	1.11	1.37
1999	0.34	0.50	0.46	0.34	1.04	1.39
2000	0.33	0.49	0.44	0.33	1.01	1.36
2001	0.33	0.50	0.43	0.34	0.97	1.31
2002	0.31	0.46	0.41	0.31	0.95	1.15
2003	0.30	0.46	0.40	0.31	0.96	1.15
2004	0.30	0.46	0.40	0.31	0.98	1.12

NOTE: Some of the standard error estimates in this table may differ from those previously published due to changes in the generalized variance parameters developed by the U.S. Census Bureau.
